Agile methodologies, created to improve quality in software code, increasingly are being applied to hardware verification. This is less of a drastic shift than it might first appear. Developing a verification testbench is largely software, and similar methodologies can be used for reducing bugs in hardware.

Using Software Approaches In Hardware Verification

The software team needs to go develop their software, so that once your hardware is ready, they have the software ready to go. There's this sort of dependency, and one way to remove that dependency is to provide the software team with higher-level models,

engineering, verification and validation is the process of checking that a software system meets specifications and that it fulfills its intended purpose. It may also be referred to as software quality control. It is normally the responsibility of software testers as part of the software development lifecycle. In simple terms, software verification is:
