### Volcanoes Questions and Answers | Study.com

A volcano is a rupture in the crust of a planetary-mass object, such as Earth, that allows hot lava, volcanic ash, and gases to escape from a magma chamber below the surface. Earth's volcanoes occur because its crust is broken into 17 major, rigid tectonic plates that float on a hotter, softer layer in its mantle. 4.0 1 vote

### What is the study of volcanoes called - Answers

Earthquakes and volcanoes occur in relationship to each other. Magma reaches the surface through volcanic structures. Volcano eruptions can be of various types: quiet and explosive. Volcanoes are classified by how they are formed (quiet or explosive eruption) and the resulting land formation (shield, cinder cone, or composite/stratovolcano).

### 6.F Post Assessment - Science Matters

Volcanoes are loosely classified into three categories: Extinct, dormant, and active. In ancient times before formal geologic study was possible, a volcano was often considered extinct if it hadn't erupted within anyone's memory and showed no signs of activity (such as smoke or lava production).
