The complexity of pavement analysis and design stems from diverse pavement materials, heavy traffic, and changing climate. The reliability of a pavement design depends on the extent of representation of this complexity in the prediction of various forms of distress that

The design models for both flexible and rigid pavements, to be mentioned in Chapters 5 and 6, require the strength of each layer of the pavement to be expressed as the elastic modulus. For granular soils, California Bearing Ratio (CBR) test is the most common way for determining the elastic modulus of subgrade.
