The two resistors that are in parallel are grouped as Req2 in the equivalent circuit below and their resistance is given by the equation $1 / \text{Req}2 = 1 / 100 + 1 / 200$ Solve to obtain $\text{Req}2 = 200 / 3 \Omega$ Req1 and Req2 are in series and therefore are equivalent to R given by the sum $R = \text{Req}1 + \text{Req}2 = 500 + 200 / 3 = 1700 / 3 \Omega$

This is an interesting series-parallel circuit problem to solve, and it shows once again how a good understanding of circuit theory enables unmeasured variables to be inferred. Students often have difficulty formulating a method of solution: determining what steps to take to get from the given conditions to a final answer.

A circuit breaker in series before the parallel branches can prevent overloads by automatically opening the circuit. A 15 A circuit operating at 120 V consumes 1,800 W of total power. $P = VI = (120 \text{ V})(15 \text{ A}) = 1,800 \text{ W}$ Total power in a parallel circuit is the sum of the power consumed on the individual branches.

EE 201 series/parallel combinations - 7 Series combination Apply test voltage. Define voltages and currents. By KCL: $i_{R1} = i_{R2} = i_{R3} = i_t$ Expected, since they are in series. By KVL: $V_t - v_{R1} - v_{R2} - v_{R3} = 0$. Resistors are in series, meaning that the same current flows in all. Use Ohm's law to write voltages in terms of currents. $V_t = i_{R1} R_1 + i_{R2} R_2 + i_{R3} R_3$
