## **What Is A Lftr And**

The liquid fluoride thorium reactor (LFTR; often pronounced lifter) is a type of molten salt reactor. LFTRs use the thorium fuel cycle with a fluoride-based, molten, liquid salt for fuel. In a typical design, the liquid is pumped between a critical core and an external heat exchanger where the heat is transferred to a

reactor and is pronounced “lifter.” This type of nuclear power is generated from Thorium. Thorium is nearly as abundant as lead in the earth’s crust, making it a very common metal. LFTR reactors use thorium dissolved into liquid form coupled with salts as a fuel source.

A Liquid Fluoride Thorium Reactor (LFTR) is a type of Molten Salt Reactor (MSR) that can use inexpensive Thorium for fuel (thorium becomes uranium inside the reactor). A slightly different type of MSR can consume the uranium/plutonium waste from solid-fueled reactors as fuel.
